

List of Claims:

1. (Currently amended) A structure suitable for converting a non-touch screen display into a touch screen display for a computing device comprising:

a touch screen;

a casing;

the casing having a first side and a second side, the first and second sides are oriented to face to each other and are non-pivoting in relation to one another;

the first side of the casing having an opening for the touch screen;

the second side of the casing being closed and lacking any openings;

at least one casing surface;

a controller for the touch screen;

a computing device software driver for the touch screen;

a connection from the controller of the touch screen to the computing device,

whereby the casing is positioned over and substantially around the display for the computing device such that the touch screen in the casing opening is oriented directly over the display to convert a non-touch screen display to a touch screen display.

2. (original) The structure of claim 1 wherein the connection to the computing device is a Universal Serial Bus, Fire Wire, wireless, or cable connection.

3. (original) The structure of claim 1 wherein the casing further comprises at least one outer casing surface and at least one inner casing surface, whereby the at least one outer casing surface and the at least one inner casing surface define a space for the display to fit.

4. (original) The structure of claim 1 wherein the casing comprises a plastic composite.

5. (original) The structure of claim 1 wherein the casing further comprises at least one pivotable stand, which is positioned opposite to the opening of the casing, whereby the at least one stand supports the structure and the display.

6. (currently amended) A structure suitable for converting a non-touch screen display into a touch screen display for a computing device comprising:

a touch screen;

a casing;

the casing having a first side and a second side, the first and second sides are oriented to face to each other;

the first side of the casing having an opening for the touch screen;

the second side of the casing being closed and lacking any openings;

at least one casing surface;

a controller for the touch screen;

a computing device software driver for the touch screen;

a connection from the controller of the touch screen to the computing device;

[the casing surface having at least one pivotable stand;]

whereby the casing is positioned over and substantially around the display for the computing device such that the touch screen in the casing opening is oriented directly over the display to convert a non-touch screen display to a touch screen display [and whereby the at least one stand supports the casing and the display].

7. (original) The structure of claim 6 wherein the connection to the computing device is a Universal Serial Bus, Fire Wire, wireless, or cable connection.

8. (original) The structure of claim 6 wherein the casing further comprises at least one outer casing surface and at least one inner casing surface, whereby the at least one outer casing surface and the at least one inner casing surface define a space for the display to fit.

9. (original) The structure of claim 6 wherein the casing comprises a plastic composite.

10. (currently amended) A method of using structure suitable for converting a non-touch screen display into a touch screen display for a computing device, said structure comprising a touch screen; a casing; the casing having a first side and a second side, the first and second sides are oriented to face to each other; the first side of the casing having an opening for the touch screen; the second side of the casing being closed and lacking any openings; the casing having [and] at least one outer casing surface and at least one inner casing surface; the at least one outer casing surface and the at least one inner casing surface further defining a space for the display; a controller for the touch screen; a computing device software driver for the

touch screen; a connection from the controller of the touch screen to the computing device, comprising the following steps:

Placing the casing over and substantially around the display into the space defined by the at least one outer casing surface and the at least one inner casing surface;

Installing the computing device software driver; and

Attaching the connection from the controller of the touch screen to the computing device,

Whereby the touch screen in the casing opening is oriented directly over the display to convert a non-touch screen display to a touch screen display.

11. (cancel).

12. (original). The method of claim 10 further comprising moving a pivotable stand on the casing from a first closed position to a second opened position.

13. (new) The structure of claim 6 wherein the casing further comprises at least one pivotable stand, which is positioned on the second side of the casing, whereby the at least one stand supports the structure and the display.
